After main combustion, the secondary combustion process, which has longer combustion duration and relatively lower heat release rate, followed, as shown in Fig. 2. In early studies, secondary combustion is reported as the combustion of mixture that is un-oxidized during the main combustion due to its locally lean [14] or rich [15] stoichiometry.

Saturn V/4-260 American orbital launch vehicle. Boeing study, 1967-1968. Use of full length 260 inch solid rocket boosters with stretched Saturn IC stages presented problems, since the top of the motors came about half way up the liquid oxygen tank of the stage, making transmission of loads from the motors to the core vehicle complex and adding a great deal of weight to the S-IC.
